

Sample projects for E0240 (Aug'26)

1. Collect a queuing network for any real time system and construct a simulator for the network. The simulator should capture key performance metric (e.g., queue occupancy) of the network.
2. Use an existing simulator (e.g., gem5, booksim). Modify the simulator to incorporate a new feature and verify the feature.
3. Perform a detailed design space exploration with an existing simulator and extract key observations.
4. Construct a simulator as well as models for distributed system. Verify the simulator with the model.
